

My commitment towards the end result.

The first thing to say is what I commit towards this project, what deliverable I will bring. My deliverable consists of making the main API for our web app. I will be doing this in the Go programming language and make a gRPC with it. I have no prior experience with either the language or the framework.

I am quite motivated and scared at the same time for this project. This is because we had a lot of freedom in choosing what we had to do. Since you can decide what you want to learn it gives a lot of extra motivation in comparison to being told what to learn. At the same time it is quite scary since I am going into something completely new. Despite being anxious I am really looking forward to learning Golang and learning how to make another API than a REST API. Especially Go is a really trending topic that despite being quite young is already used by a LOT of big companies. I think this really proves the potential of Go and makes me motivated to learn it. I am also really interested in learning another API format in gRPC. From doing research I found out that gRPC works very differently from all the APIs I have seen up to this point and I am curious to find out how it works and what advantages it has.

Of course everyone one of our team has their own deliverable, but that does not mean we can't help each other. I think the whole team will work and help a bit in every deliverable to we all have an understanding to a certain level how each part of our web app works. Naturally the one that has those parts as their deliverable will do the most work on that part. This way of working will also teach all of the members a bit about each technology.

The group that I work with, including me, have known each other since middle school so we often work together on projects and for school in general. I believe this makes us a really good team and motivated to work for each other since we do not want to hinder the others.
